each information. Adding visual cues with simplistic design create a more legible visual information.

9. Help users recognize, diagnose, and recover from errors

Suggested Schools Page - I tried to implement an error message to show another useful feature of how some of the applications might be too old and might have been missed by the user.

Throughout the App - I avoided to let users get to a point where they might make a mistake. Instead, I wanted to create a friendly system that became a template to use, instead of freestyle the navigation.

10. Help and documentation

What Resources Are You Looking For? Page - Since I am focusing on international students and admission process for them, I had to add English Proficiency testing requirements as one of the sections of the quiz. Therefore, it was really important to also add what they actually mean for the users who have not seen or heard of the these crucial admission requirements before. Therefore, I aded a pop up menu with a question mark to let the user know about a recourse built in the app.

I was definitely missing an explanation of this section in the initial design of the prototype making people with US nationalities get confused as well.
